Demo Maker v0.1.4

Leaner, More Reliable, Better Prepared

Slava - Demo Maker Team

demo-maker

Agenda

- PDF page generation - dependency reduction
- Build reliability - output delivery fix
- Audio normalisation - TTS format enforcement
- Live demo
- What’s coming next

demo-maker

PDF Page Generation

Removing an unnecessary dependency

demo-maker

The Old Approach

- `split-pdf` command broke a PDF into one image per slide
- Required `poppler-utils` - a third-party system package
- `poppler-utils` had to be bundled into the Docker image

> *Larger Docker images mean slower distribution and deployment*

Image placeholder: diagram showing Docker image containing split-pdf and poppler-utils alongside Marp

demo-maker

The Fix

- Marp - already used to generate the PDF - can produce per-page images directly
- `split-pdf` command has been removed
- `poppler-utils` dependency has been removed

Result

- Smaller Docker image
- Faster deployment
- One less dependency to maintain

Build Reliability

Output files that always arrive

The Problem

- The `build` command merges assets and delivers a final file to an output folder
- The final copy step did not always complete
- Output file sometimes never reached its destination

- A temporary working folder used during the merge was not being cleaned up
- Leftover files accumulated after each run

demo-maker

The Fix

- Final file is now reliably delivered to the correct destination
- Temporary folder is removed once the build completes

> *Builds are trustworthy - the output you expect is where you expect it, every time*

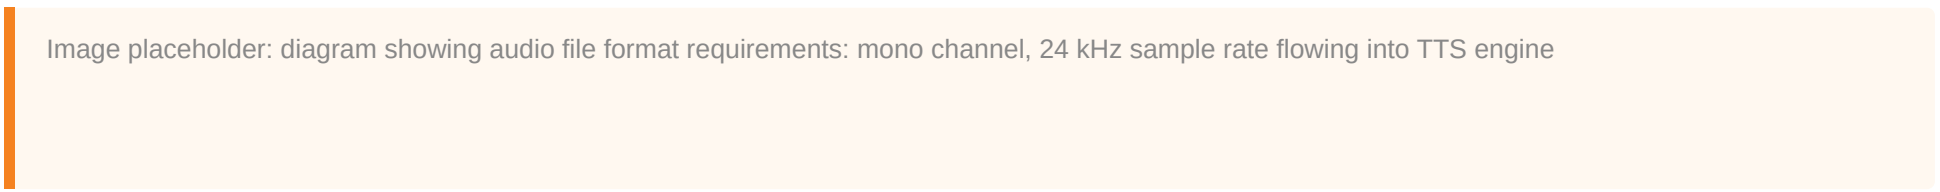

Audio Normalisation

Consistent input for TTS synthesis

demo-maker

Why Format Matters for TTS

- TTS (Text-To-Speech) tools are sensitive to reference audio format
- They expect: mono channel + 24 kHz sample rate
- Mismatched format produces degraded or inconsistent synthesis output

demo-maker

The New Normalise Command

- A new command accepts a reference audio file and normalises it automatically
- Converts to mono
- Sets sample rate to 24 kHz

Benefit

- Removes a manual preparation step previously left to the operator
- TTS stage always receives audio in the correct format

demo-maker

Live Demo

Seeing the changes in practice

demo-maker

What’s Next

The road ahead

demo-maker

Whisper Integration

- Whisper transcribes spoken audio into text, feeding back into the workflow
- Two options under evaluation:

WhisperKit (preferred candidate)

- Lightweight alternative, installable via Brew
- No Python dependencies

Faster-Whisper

- Remains available as a fallback

demo-maker

Voice Generation Pipeline

- Defining and documenting the end-to-end steps to produce synthesised speech from text
- Lays the groundwork for a consistent, repeatable audio pipeline

Image placeholder: diagram of end-to-end voice generation pipeline: text input, normalisation, TTS synthesis, audio output

demo-maker

Summary

- **PDF generation** - smaller image, fewer dependencies
- **Build reliability** - output is always delivered, temp files cleaned up
- **Audio normalisation** - TTS always receives correctly formatted input

> *Demo Maker v0.1.4 is leaner, more predictable, and better prepared for the audio pipeline ahead*

demo-maker

Thanks! Ciao.

Questions welcome
